Ph.D. Student

CIRAIG – Ecole Polytechnique de Montreal

Plan

- Project description
- Comparisons
- Results (\rightarrow preliminary!)
- Conclusion

Project description and objective

Midpoint indicators

Water scarcity (quantity)

Water stress (quantity and quality)

- Endpoint indicators on human health
 - Deprivation for domestic, agricultural anf fisheries users (Pfister, Boulay, Motoshita)

Objective: to understand the implications of modeling choices, data and hypothesis in scarcity indicators

Description

4 methods

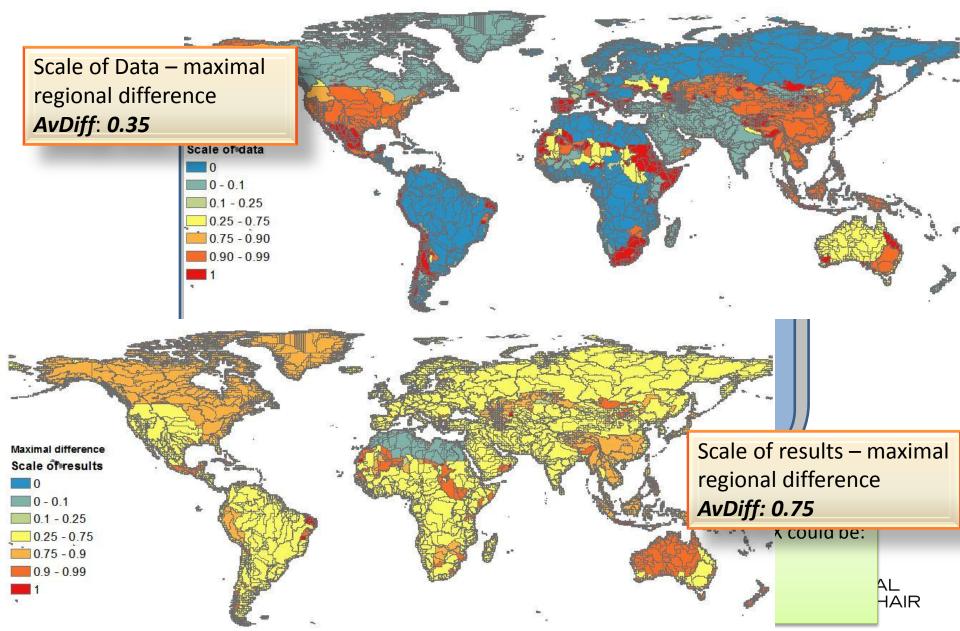

- 1. Boulay (simplified)
- 2. Pfister
- 3. Swiss Ecoscarcity
- 4. Blue water scarcity (WFN)
- 5 questions
 - 1. Regional choices
 - 2. Consumption or withdrawal-based scarcity assessment
 - 3. Temporal variability
 - 4. Source of water (surface, ground or unspecified)
 - 5. Source of data

2 indicators

- 1. Rank correlation coefficient (Spearman)
- 2. Mean difference coefficient (Gini)

Regional Choices – what is the most relevant scale of data and of results?

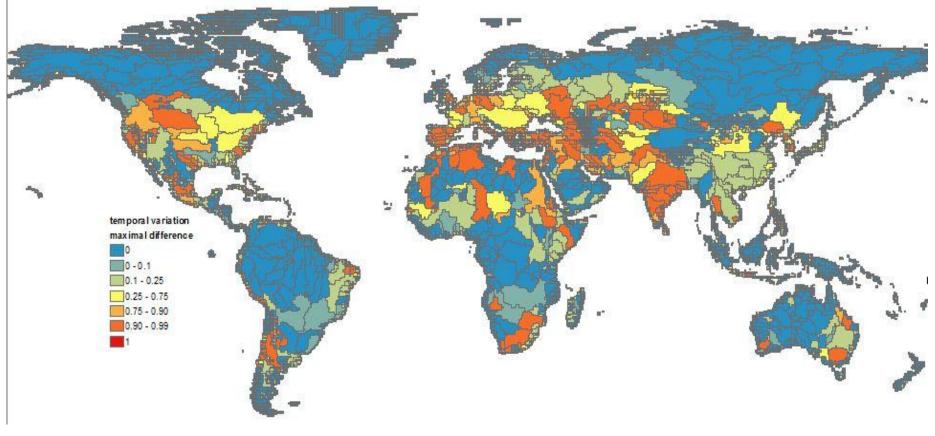

Consumption vs withdrawal-based scarcity

Scarcity is fct() of: Av Diff RCC Withrawal-to-availability ? Pfister 83% 0.15 Consumption-to-availability ? Boulay 82% 0.14 1.5 M-Pfister Difference between withdrawal and consumption based methods (W-C) M-BoulayC 1.0 **BUT...Scarcity based** on consumption is 0.5 higher (then withdrawal-based) 0.0 in Boulay and lower 1.0 00 in Pfister -0.5 -1.0 -1.5 Average of Withdrawal and consumption based method

Temporal variation

Comparing monthly versus annual assessment

RCC: 96% AvDiff: 0.03

Source of data

Source of water:

- General
- Unspecified
- Surface
- Ground
- Source of data:

Using Pfister's consumption-based indicator to compare results with:

Source

Surface

Ground

Unknown

- WaterGap data
- WFN data

RCC	Mean Difference
82%	0.10

LIFE CYCLE CHAIR

RCC

97%

86%

96%

Mean

0.04

0.09

0.04

Difference

Conclusion

- Source of water or regional variations only relevant in some regions
- <u>Regional choices</u>, <u>source of data</u> and <u>consumption vs withdrawal-based</u> <u>scarcity</u> significantly affect results, but:
 - Which data source is the most representative?
 - How should scarcity be defined when using consumption-to-availability ratios?
 - What is the most relevant spatial resolution?
