

Biodiversity impacts of recent land-use change driven by increases in agri-food imports

Livia Cabernard, Stephan Pfister, Stefanie Hellweg
Chair of Sustainability Assessment of Food and Agricultural Systems
Technical University of Munich

LCA Discussion Forum 87
September 3rd, 2024, Zürich

Motivation

- **Tropics** are the hotspot of biodiversity loss from land-use change (LUC)
- Land is used for producing commodities **exported** and consumed abroad

Assessing spatially-resolved global biodiversity impacts resulting from LUC between 1995 and 2022

Identifying how shifts in supply chains contribute to LUC impacts over time using multi-regional input-output (MRIO) analysis

Methods

1.

189 countries x 163 sectors, 1995–2022

Compile MRIO database Resolved EXIOBASE (REX3)

Stadler et al 2020 (EXIOBASE 3), Lenzen et al 2016 (Eora26), FAOSTAT, BACI (trade)

2.

including land abandonment

Calculate land-use change impacts from 1995 to 2022

LUH2 dataset, Chaudhary et al 2015, UNEP-SETAC 2016

3.

Assess full supply chain impacts without double counting

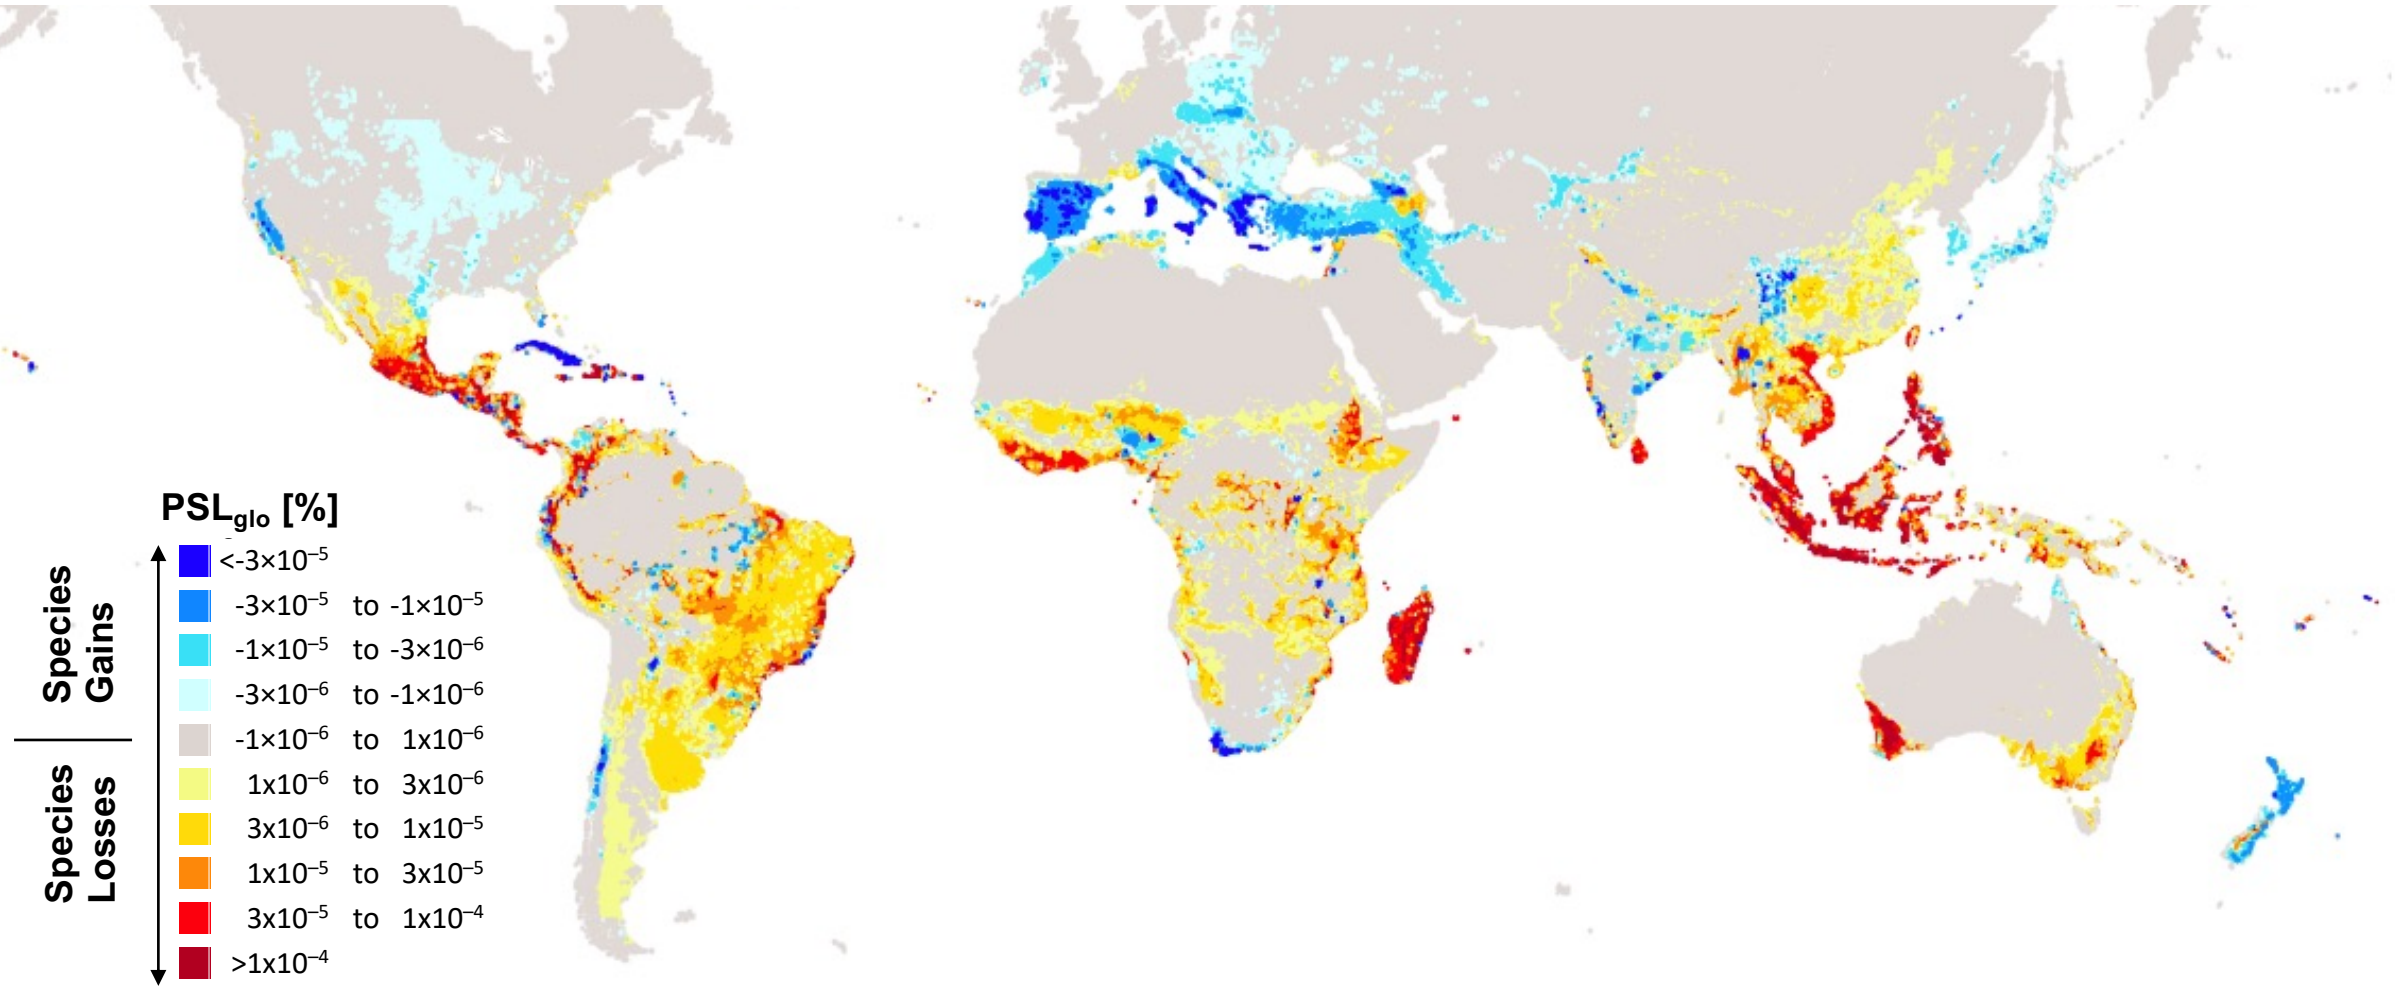

Cabernard et al. 2019

4.

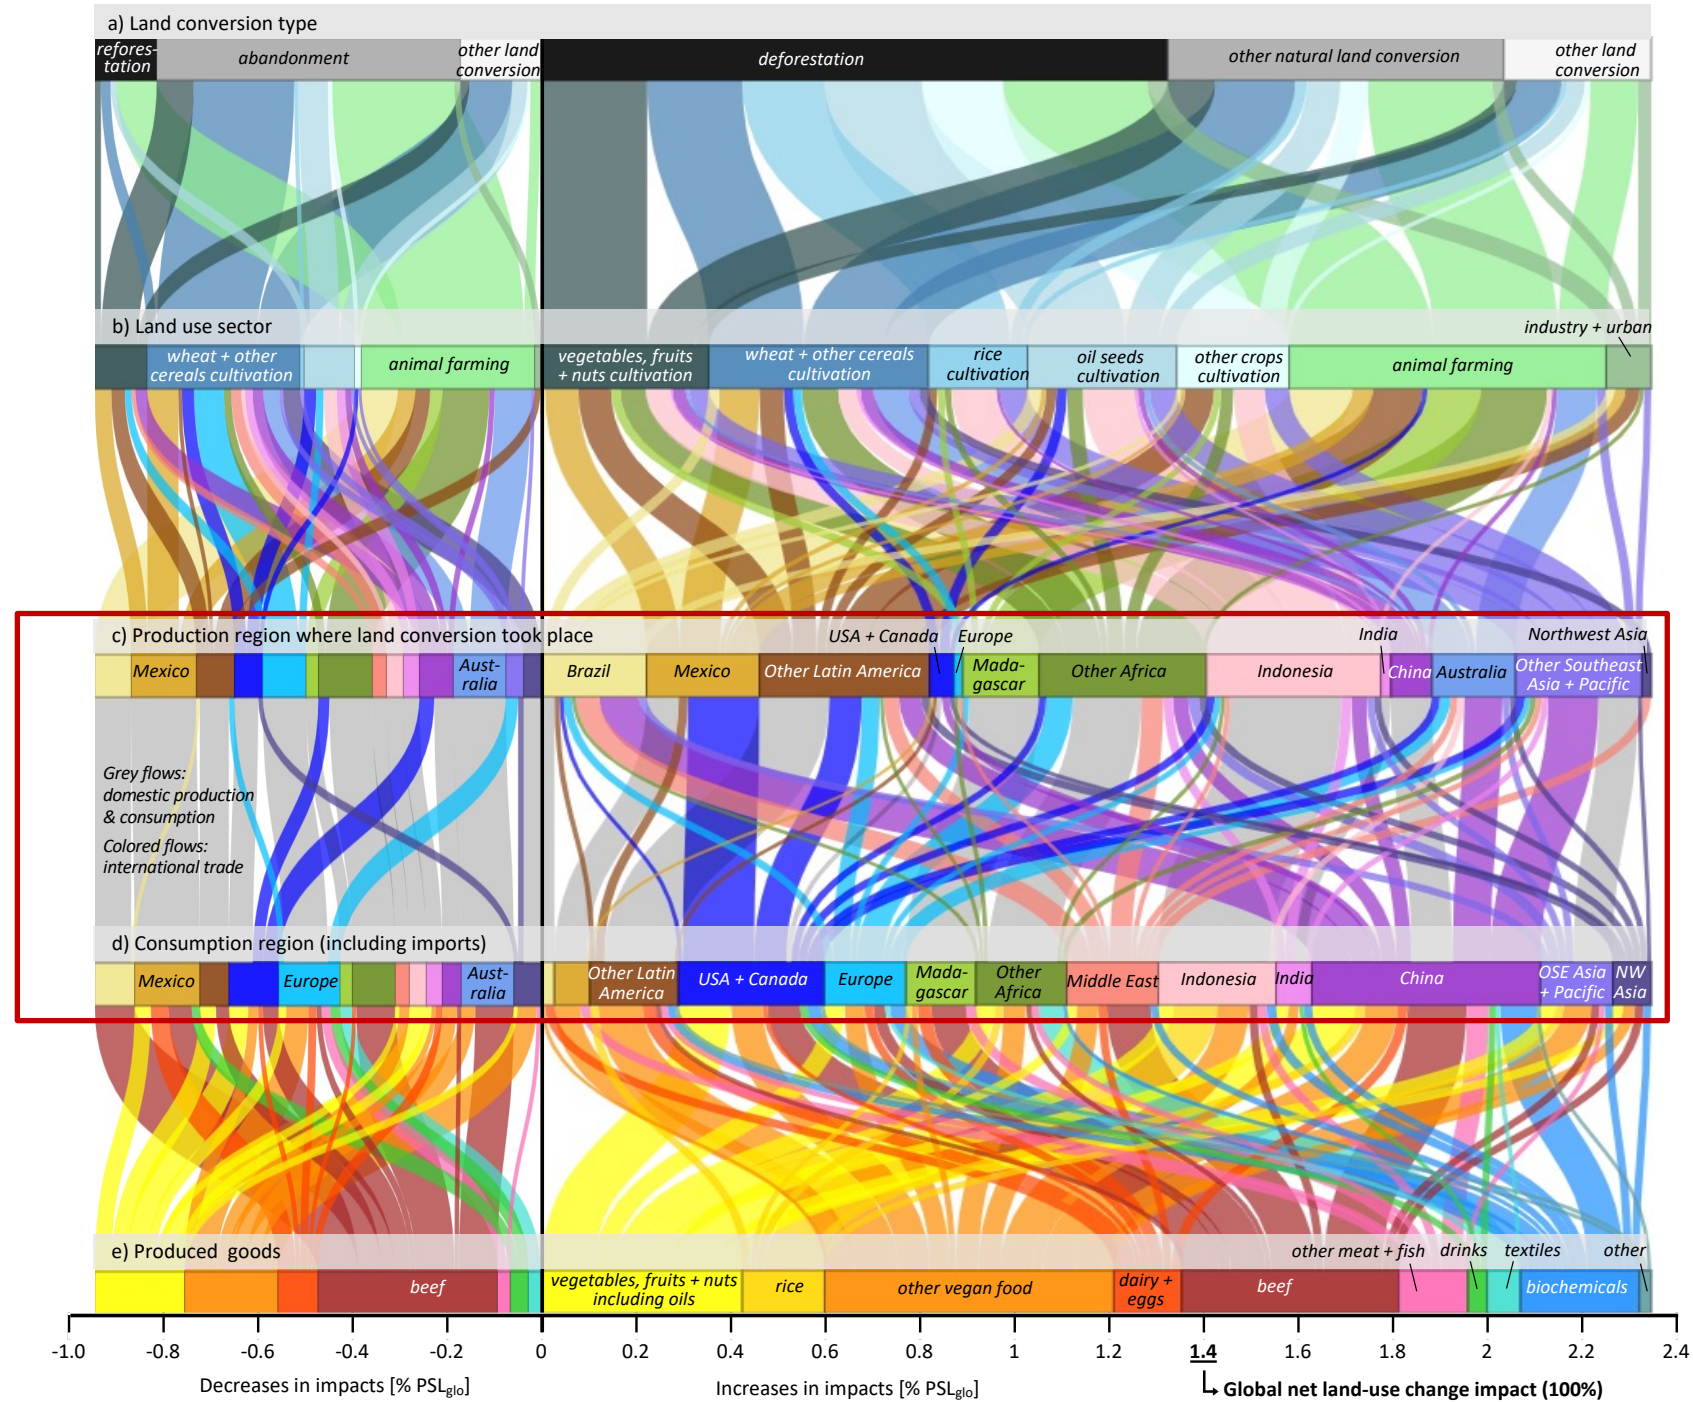

Marginal allocation: Allocate LUC impacts to shifts in supply and demand

Results: Land-use change biodiversity impacts from 1995 to 2022

Results: Global land-use change impacts linked to shifts in the supply chain from 1995 to 2022

Results: Global LUC impacts linked to shifts in the supply chain from 1995 to 2022:

Discussion and Conclusions

Methodical improvements

- Marginal vs total allocation in MRIO leads to three times higher impacts embodied in trade
- Spatially-resolved global LUC impact assessment including land abandonment →40% higher LUC impacts
- REX3 database (<https://zenodo.org/records/10354283>) covers 189 countries, 163 sectors & set impact categories: biodiversity loss from land use and land-use change, water stress, climate and PM health impacts

Limitations & Outlook

- Account for land-use intensities and fragmentation →Scherer et al 2022
- Link REX3 to FABIO & FORBIO for enhanced product resolution →Bruckner et al
- Scenario implementation

Policy implications

- Biodiversity gains in temperate regions came at the expense of outsourcing agri-food supply chains to tropical biodiversity hotspots →Net LUC impacts exceed the biodiversity target ~50-fold
- We need policies to i) protect high-biodiversity regions by halting habitat destruction and ii) stop countries from importing agri-food products from tropical biodiversity hotspots.
